

Mass Flow Controller Mounting Attitude Selection Guide

The accuracy of many models of Mass Flow Controllers can be affected by the different mounting attitudes of each tool. They should be calibrated in the same position as used during process. If no mounting attitude is specified or known by the end user, we will calibrate it with the last known mounting attitude. It is VERY helpful for us to know the make/model of the tool that your MFC's will be installed in. Mounting attitudes can often be confirmed or identified with this information.

If you are unsure of which diagram best fits your device(s), please call:
